# Economics 101A (Lecture 14)

Stefano DellaVigna

March 11, 2014

#### Outline

- 1. Production: Introduction
- 2. Production Function
- 3. Returns to Scale
- 4. Two-step Cost Minimization

## **1 Production:** Introduction

• Second half of the economy. **Production** 

- Example. Ford and the Minivan (Petrin, 2002):
  - Ford had idea: "Mini/Max" (early '70s)
  - Did Ford produce it?
  - No!
  - Ford was worried of cannibalizing station wagon sector
  - Chrysler introduces Dodge Caravan (1984)
  - Chrysler: \$1.5bn profits (by 1987)!

• Why need separate treatment?

• Perhaps firms maximize utility...

- ...we can be more precise:
  - Competition
  - Institutional structure

### **2 Production Function**

- Nicholson, Ch. 9, pp. 303-310; 313-318
- Production function:  $y = f(\mathbf{z})$ . Function  $f: \mathbb{R}^n_+ \to \mathbb{R}_+$
- Inputs  $\mathbf{z} = (z_1, z_2, ..., z_n)$ : labor, capital, land, human capital
- Output y: Minivan, Intel CPU, mangoes (Philippines)
- Properties of *f*:
  - no free lunches: f(0) = 0
  - positive marginal productivity:  $f'_i(\mathbf{z}) > 0$
  - decreasing marginal productivity:  $f_{i,i}''(\mathbf{z}) < 0$

- Isoquants  $Q(y) = \{\mathbf{x} | f(\mathbf{x}) = y\}$
- Set of inputs  $\mathbf{z}$  required to produce quantity y
- Special case. Two inputs:

– 
$$z_1 = L$$
 (labor)

 $-z_2 = K$  (capital)

- Isoquant: f(L, K) y = 0
- Slope of isoquant dK/dL = MRTS

- Convex production function if convex isoquants
- Reasonable: combine two technologies and do better!

• Mathematically, convex isoquants if  $d^2K/d^2L > 0$ 

• Solution:

$$\frac{d^{2}K}{d^{2}L} = -\frac{f_{L,L}''f_{K}' - 2f_{L,K}''f_{L}' + f_{K,K}''\left(f_{L}'\right)^{2}/f_{K}'}{\left(f_{K}'\right)^{2}}$$

• Hence,  $d^2K/d^2L > 0$  if  $f_{L,K}'' > 0$  (inputs are complements in production)

### **3** Returns to Scale

- Nicholson, Ch. 9, pp. 310-313
- Effect of increase in labor:  $f'_L$
- Increase of all inputs:  $f(t\mathbf{z})$  with t scalar, t > 1
- How much does output increase?

- Decreasing returns to scale: for all 
$$z$$
 and  $t > 1$ ,  
 $f(tz) < tf(z)$ 

- Constant returns to scale: for all  $\mathbf{z}$  and  $t > \mathbf{1}$ ,  $f(t\mathbf{z}) = tf(\mathbf{z})$ 

- Increasing returns to scale: for all z and t > 1, f(tz) > tf(z)

- Example:  $y = f(K, L) = AK^{\alpha}L^{\beta}$
- Marginal product of labor:  $f'_L =$
- Decreasing marginal product of labor:  $f_{L,L}'' =$
- MRTS =

• Convex isoquant?

• Returns to scale:  $f(tK, tL) = A(tK)^{\alpha} (tL)^{\beta} = t^{\alpha+\beta}AK^{\alpha}L^{\beta} = t^{\alpha+\beta}f(K,L)$ 

### 4 **Two-step Cost minimization**

- Nicholson, Ch. 10, pp. 333-341
- Objective of firm: Produce output that generates maximal profit.

- Decompose problem in two:
  - Given production level y, choose cost-minimizing combinations of inputs
  - Choose optimal level of y.

• First step. Cost-Minimizing choice of inputs

• Two-input case: Labor, Capital

- Input prices:
  - Wage w is price of L
  - Interest rate  $\boldsymbol{r}$  is rental price of capital  $\boldsymbol{K}$
- Expenditure on inputs: wL + rK

• Firm objective function:

$$\min_{L,K} wL + rK$$
  
s.t.f(L,K)  $\geq y$ 

- Equality in constraint holds if:
  - 1. w > 0, r > 0;
  - 2. f strictly increasing in at least L or K.
- Counterexample if ass. 1 is not satisfied

• Counterexample if ass. 2 is not satisfied

• Compare with expenditure minimization for consumers

• First order conditions:

$$w - \lambda f'_L = \mathbf{0}$$

 $\quad \text{and} \quad$ 

$$r - \lambda f'_K = \mathbf{0}$$

• Rewrite as

$$\frac{f_L'(L^*, K^*)}{f_K'(L^*, K^*)} = \frac{w}{r}$$

• MRTS (slope of isoquant) equals ratio of input prices

• Graphical interpretation

• Derived demand for inputs:

$$-L = L^*(w, r, y)$$

$$-K = K^*(w, r, y)$$

• Value function at optimum is **cost function**:

$$c(w, r, y) = wL^{*}(r, w, y) + rK^{*}(r, w, y)$$

- Second step. Given cost function, choose optimal quantity of y as well
- Price of output is p.
- Firm's objective:

$$\max py - c(w, r, y)$$

• First order condition:

$$p - c'_y(w, r, y) = \mathbf{0}$$

• Price equals marginal cost – very important!

• Second order condition:

$$-c_{y,y}^{\prime\prime}\left(w,r,y^{*}\right)<\mathsf{0}$$

• For maximum, need increasing marginal cost curve.
